Emergent Materials and Spectroscopic Techniques

Topological insulators

- "Topological": topological properties of the band structure in the reciprocal space
- "Insulators": well, not really. They have gap, but they are conducting (on edges)!
- Time-reversal-invariant topological insulators (Kane, Mele, Fu, Zhang, Qi, Bernevig, Molenkamp, Hasan and others, from 2006 and still on-going)

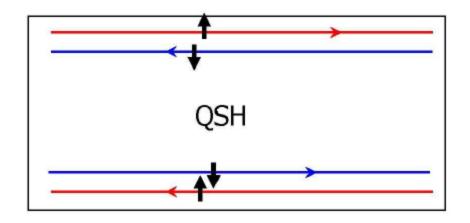

Spin-orbit coupling

$$\vec{B} = -\frac{\vec{v} \times \vec{E}}{c^2} \qquad e^{-} \qquad o_{\text{Nucleus}}$$

$$H_{SO} = \frac{\mu_B}{\hbar mec^2} \frac{1}{r} \frac{\partial U(r)}{\partial r} \vec{L} \cdot \vec{S}$$

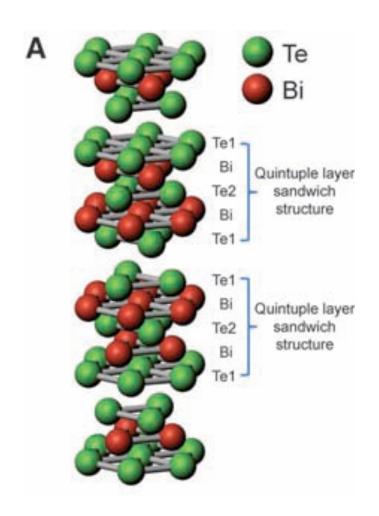

Stronger effect for heavy elements (Pb, Bi, etc.) from the bottom of the periodic system

Edge states in 2D TIs

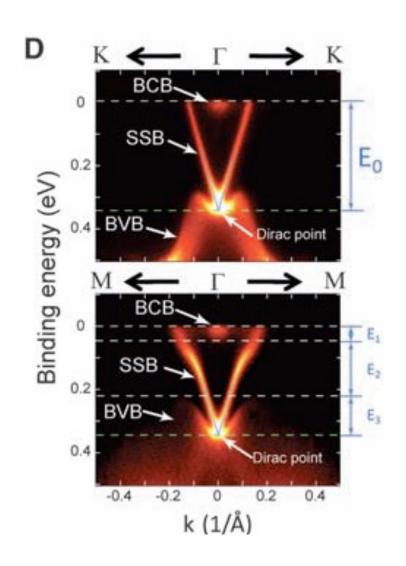

Helical modes: on each edge one pair of 1D modes related by the TR symmetry. Propagate in opposite directions for opposite spin.

JSTと東工大、新しい酸化物超電導体LaOFePを発見

2006-07-18 (黒川 卓)

科学技術振興機構(JST)は東京工業大学と協同で、層状構造の新しい酸化物 超電導体を発見した。酸化物超電導体としては遷移金属の銅(Cu)を含む物質が よく知られ、すでに産業界で実用化が始まっている。今回発見されたのは、Cuの 代わりに遷移金属の鉄(Fe)を含む酸化超電導体。超電導転移する温度(Tc)は 4Kと今のところ低いが、今後、構成元素の種類と組成比を変えることによってTc をさらに高められる可能性がある。

Superconductivity:

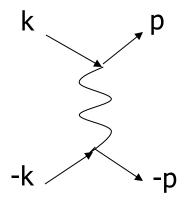

Zero-resistance state of interacting electrons

Electrons (fermions) attract each other and form bound states (bosons). Bound states condence (a'la Bose-Einstein condensation) and move fully coherently under the electric field. One needs to destroy a bound state to stop the current.

BCS theory

• If there is an attractive interaction between fermions, they always form a bound state and condense below a certain Tc

 In conventional, low Tc superconductors, an attractive interaction is provided by exchanging phonons (lattice vibrations)

Superconductivity: High-Tc

The first atom-thick material... graphene

Graphene is a two-dimensional layer of sp²-bonded carbon atoms with amazing properties...

Important investments all-around the world

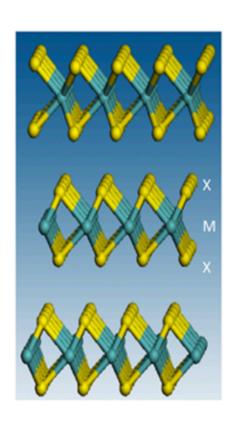

Graphene, a new substance coming from the world of atomic scale manipulation of matter, could be the wonder material of the 21st century. Discovering just how important this material will be for information and communication technologies (ICTs) is the main focus of the Seventh Framework Programme (FP7) Coordination Action GRAPHENE-CA, funded under the 'Ideas' Theme.

Graphene is not the only 2-D Material...

Understand the macroscopic electronic properties and the role of competing degrees of freedom

Study the low-energy electronic excitations

ARPES

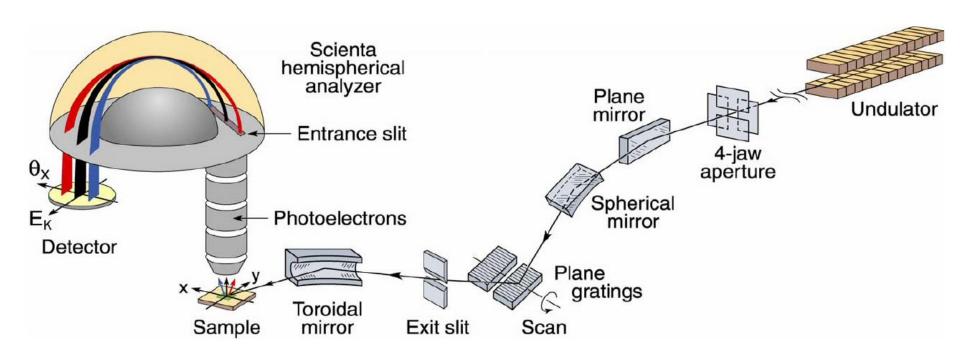

Velocity and direction of the electrons in the solid

Angle-Resolved Photo-Emission Spectroscopy (ARPES)

Working of ARPES

- An atomically flat sample is illuminated by a beam of monochromatic light.
- Due to the photoelectric effect, the sample emits electrons.
- The kinetic energy and direction of these electrons are measured by the rotatable spectrometer.
- The obtained data are used to map out the Fermi surface of the sample material.

ARPES setup

Parallel multi-angle recording

- Improved energy resolution
- Improved momentum resolution
- Improved data-acquisition efficiency

	ΔE (meV)	Δθ
past	20-40	2 °
now	2-10	0.2°

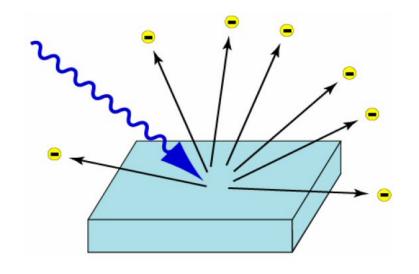

Photoelectric Effect

• Explained by Einstein (1905):

$$E_{k_{\text{max}}} = hf - \phi$$

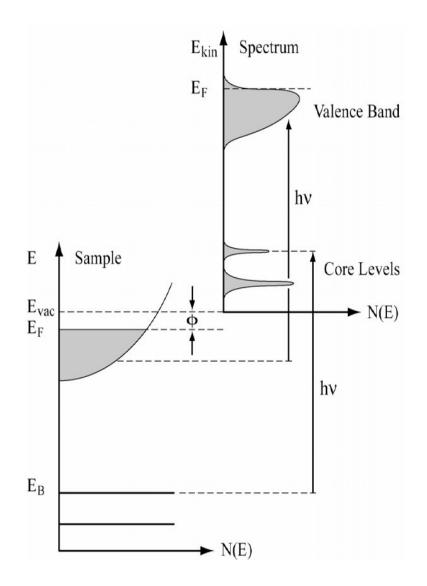

More generally,

$$E_k = hf - \phi - |E_B|$$
 where E_B is the binding energy of the electron.

Photoemission Spectra

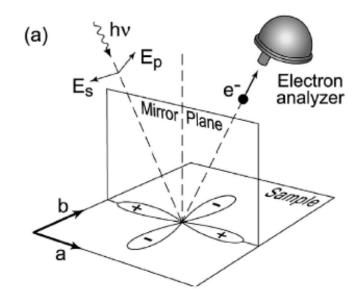

- The work function is known/ measurable.
- The photon energy is known.
- We can calculate the energy of the electron in the solid!

Basis of ARPES

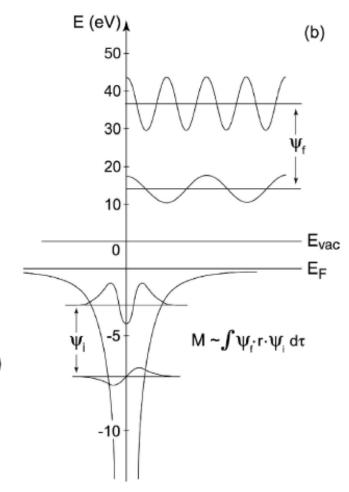

ARPES is directly measuring the components of electron momentum that are parallel to the surface

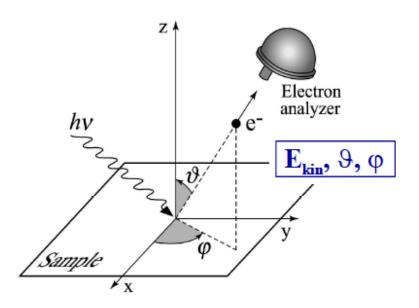

- The flat surface of the sample has translational symmetry.
 Therefore, as electrons escape from the solid, <u>linear</u>
 <u>momentum is conserved</u> parallel to the surface.
- The <u>photon momentum is small</u> and can be neglected.

$$w_{fi} = \frac{2\pi}{\hbar} |\langle \Psi_f^N | H_{int} | \Psi_i^N \rangle|^2 \delta(E_f^N - E_i^N - h\nu)$$

$$H_{int} = -\frac{e}{2mc}(\mathbf{A} \cdot \mathbf{p} + \mathbf{p} \cdot \mathbf{A}) = -\frac{e}{mc}\mathbf{A} \cdot \mathbf{p}$$

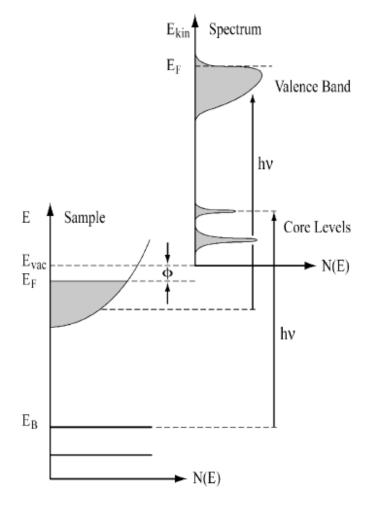

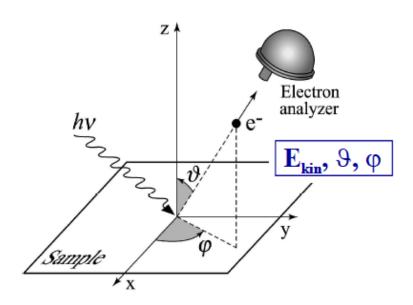

Energy Conservation

$$\boldsymbol{E_{kin}} = h\nu - \phi - |\boldsymbol{E_B}|$$

Momentum Conservation

$$\mathbf{p}_{\parallel} = \hbar \mathbf{k}_{\parallel} = \sqrt{2m \mathbf{E}_{kin}} \cdot \sin \vartheta$$

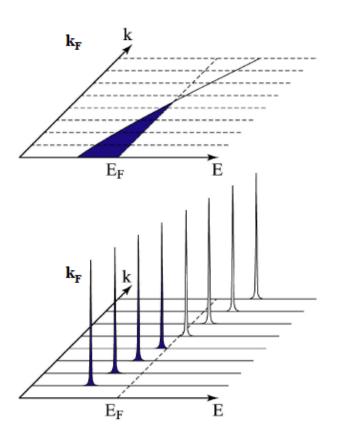

Energy Conservation

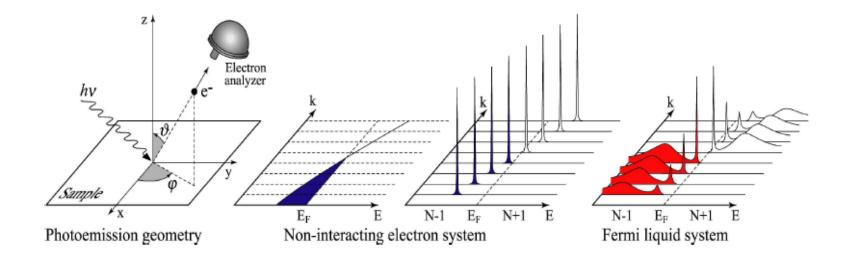

$$E_{kin} = h\nu - \phi - |E_B|$$

Momentum Conservation

$$\mathbf{p}_{\parallel} = \hbar \mathbf{k}_{\parallel} = \sqrt{2m \mathbf{E}_{kin}} \cdot \sin \vartheta$$

Electrons in Reciprocal Space

Photoemission intensity: $I(k,\omega)=I_{\theta}|M(k,\omega)|^2f(\omega)A(k,\omega)$

Single-particle spectral function

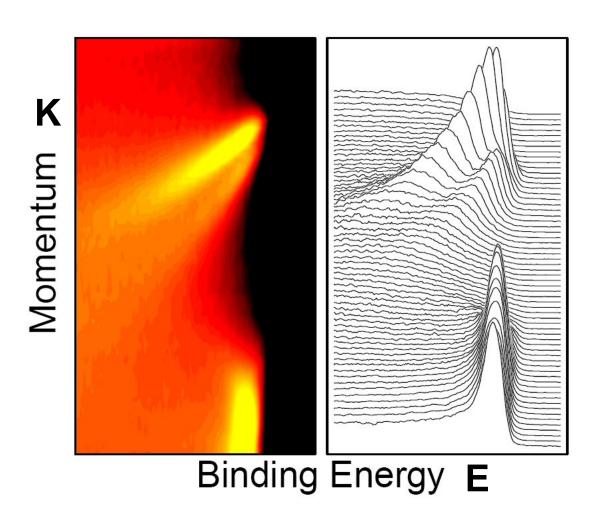

$$A(\mathbf{k},\omega) = -\frac{1}{\pi} \frac{\Sigma''(\mathbf{k},\omega)}{[\omega - \epsilon_{\mathbf{k}} - \Sigma'(\mathbf{k},\omega)]^2 + [\Sigma''(\mathbf{k},\omega)]^2}$$

 $\Sigma(\mathbf{k,}\omega)$: the "self-energy" - captures the effects of interactions

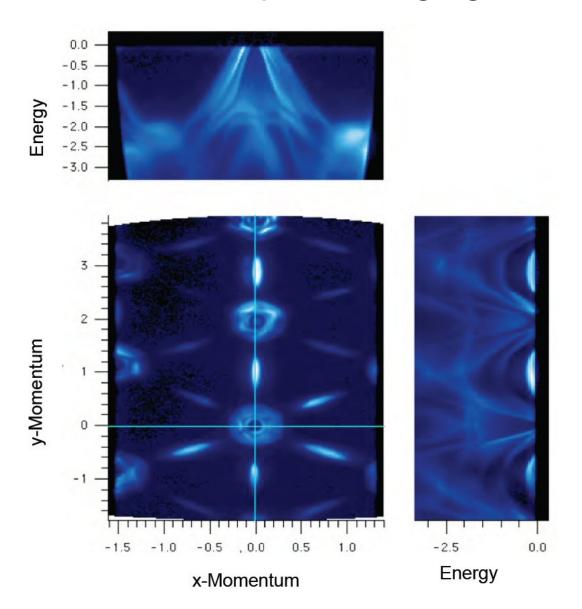

What is ARPES used for?

- ARPES is an almost ideal tool for imaging the Fermi surface of 1-D and 2-D solids.
- Since many of the high temperature superconductors are essentially 2-D materials, much of the work in this field is done using ARPES.

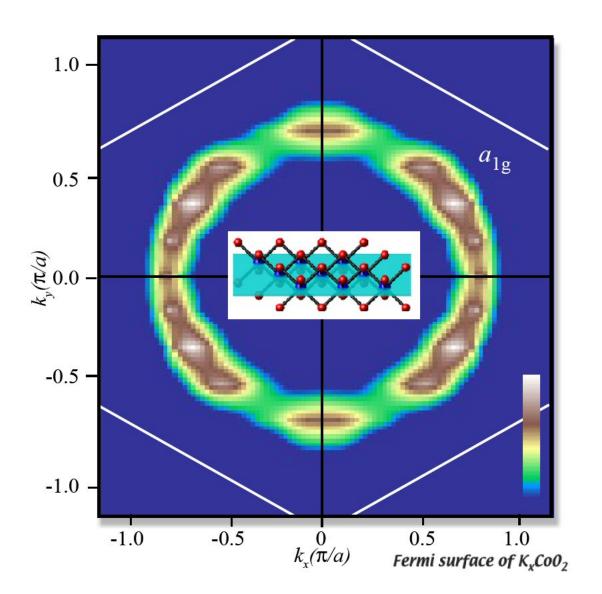

Momentum and Binding Energy

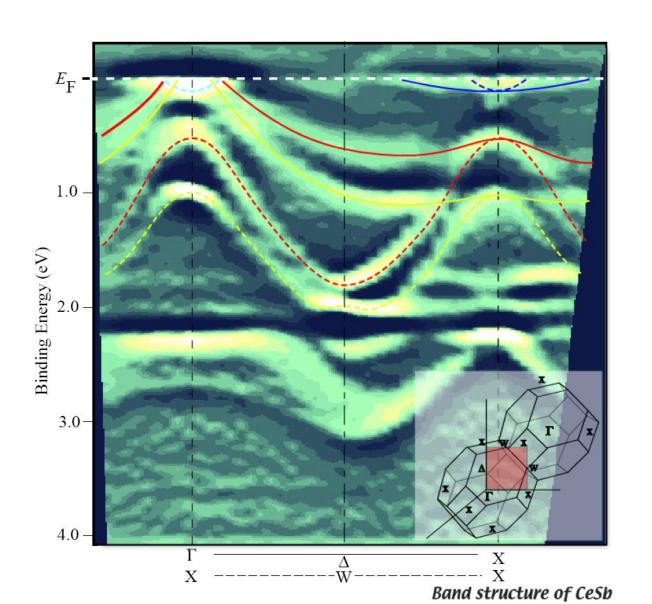

Direct k Space Imaging

Fermi Surface Images

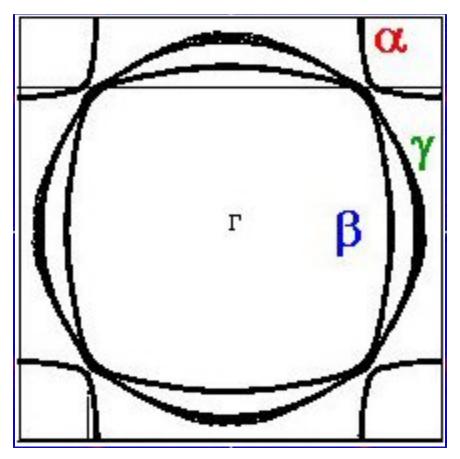

Band Structure Images

Validation of Predictions

 Sr_2RuO_4 : Alreadice and contains

Advantages

- Direct information about electronic states!
- Straightforward comparison with theory - little or no modelling.
- High-resolution information about
 BOTH energy and momentum
- Surface-sensitive probe
- Sensitive to "many-body" effects
- Can be applied to small samples (100 μm x 100 μm x 10 nm)

Limitations

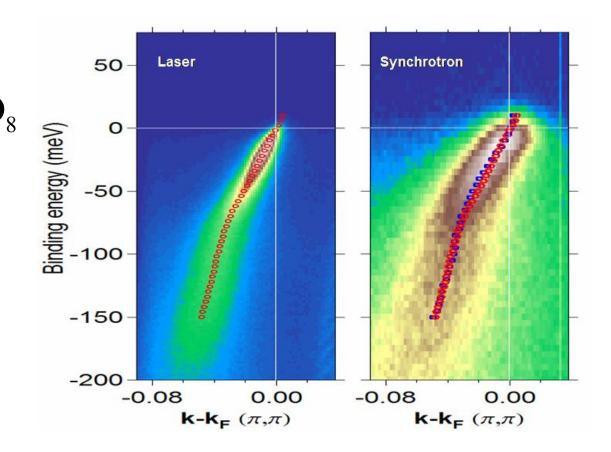

- Not bulk sensitive
- Requires clean, atomically flat surfaces in ultra-high vacuum
- Cannot be studied as a function of pressure or magnetic field

Further Advances

Laser ARPES: lower energy means sharper pictures

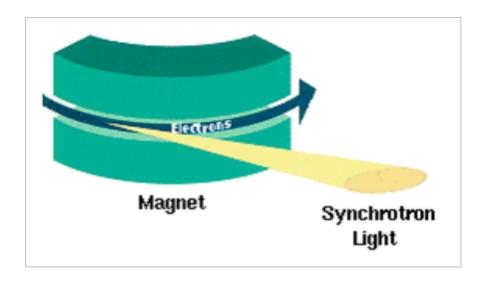

(image of $Bi_2Sr_2CaCu_2O_8$ in "nodal" direction)

Synchrotron Radiation

How is synchrotron light made?

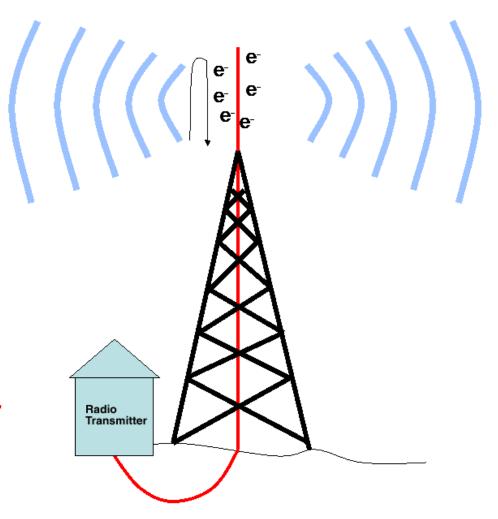

by accelerating electrons

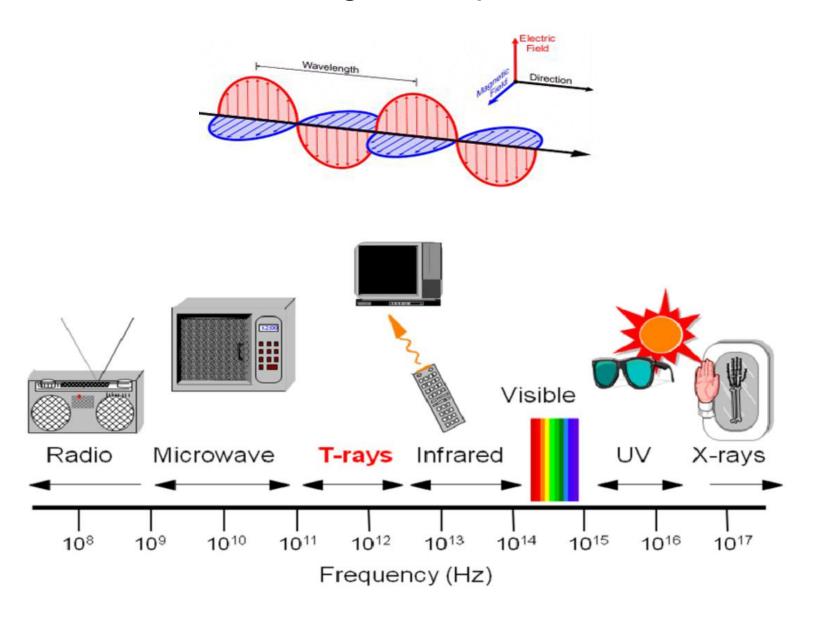

Electromagnetic Radiation

Electrons *accelerating* by running up and down in a radio antenna emit radio waves

Radio waves are nothing more than Long Wavelength Light

Electromagnetic Spectrum

How far does light travel in 1 second? 1 femtosecond?

1 sec

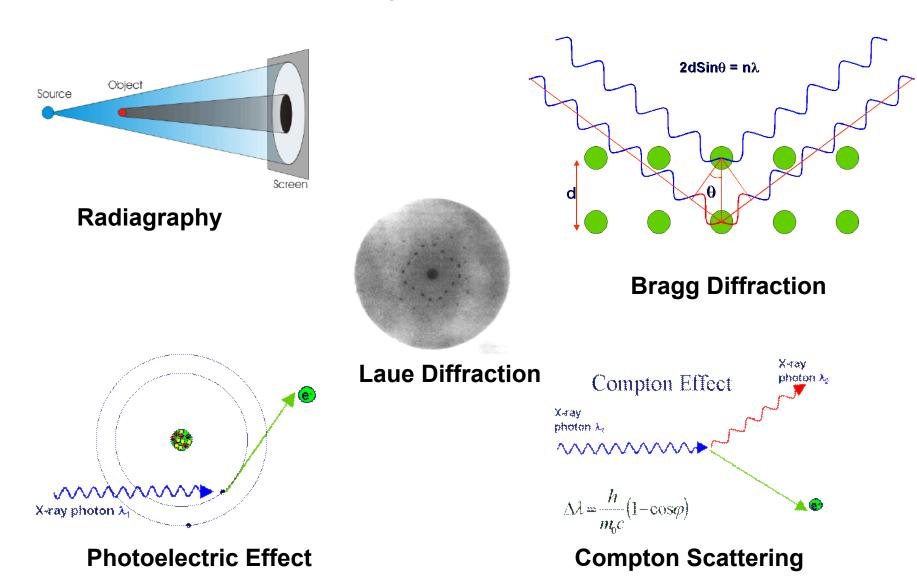

1 fs

3,000 nm (1/10 of a hair)

Interaction of photons with matter

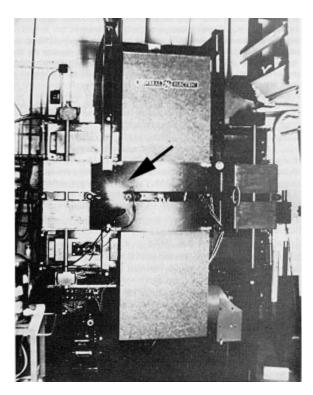

Early History

1873 Maxwell's Equations

- Made evident that changing charge densities would result in electric fields that would radiate outward
- 1887 Hertz demonstrated such waves
- 1895 Röntgen discovered X-Rays
- 1897 Larmor derived an expression for the instantaneous total power radiated by an accelerated charged particle
- 1898 Lienard's extended Larmor's result to the case of a relativistic particle undergoing centripetal acceleration in a circular trajectory
- 1947 GE's 70-MeV synchrotron: First observation of Synchrotron Light in an accelerator

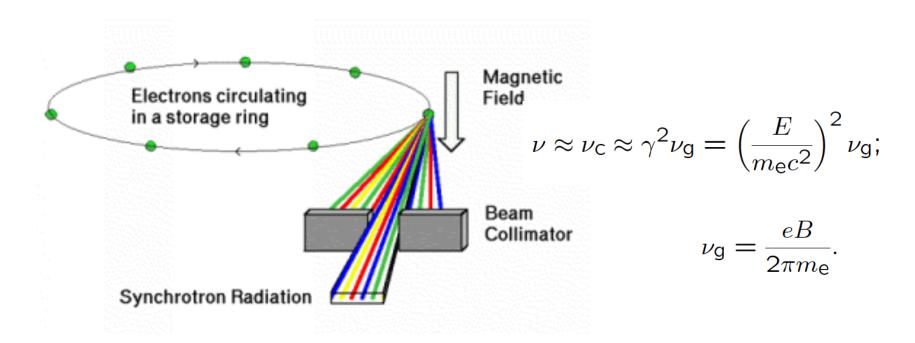

First observation of synchrotron radiation

GE Synchrotron New York State

First light observed 1947

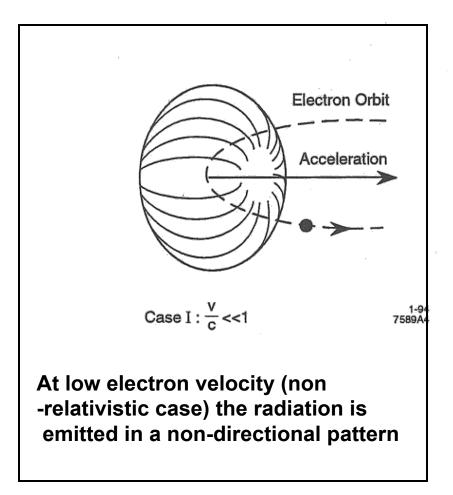

Why we need synchrotron radiation

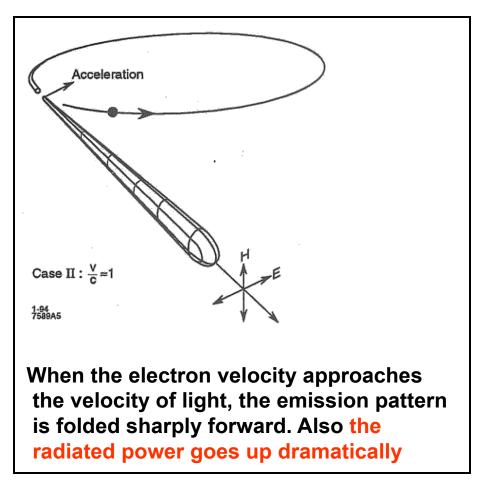

Synchrotron radiation is electromagnetic radiation emitted when charged particles are radially accelerated (move on a curved path).

Synchrotron Radiation

- Radiated power increases at higher velocities
- Radiation becomes more focused at higher velocities

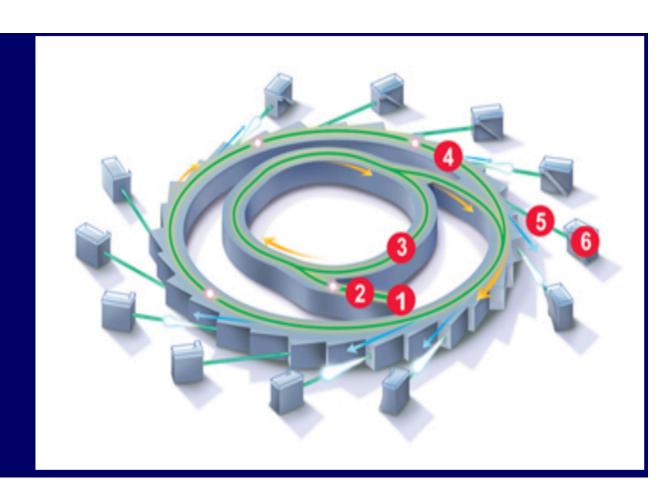

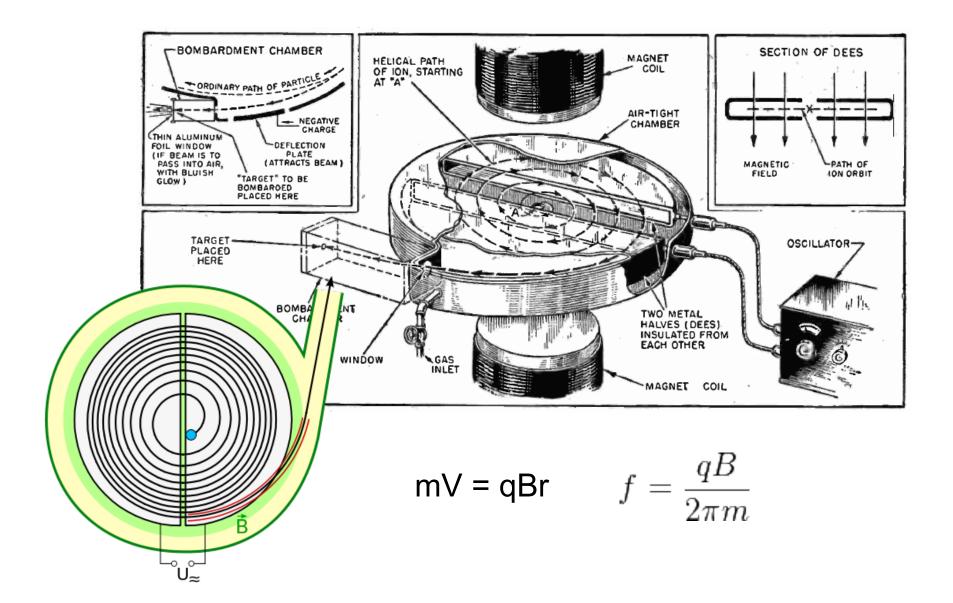

How a storage ring light source works

Parts of Synchrotron

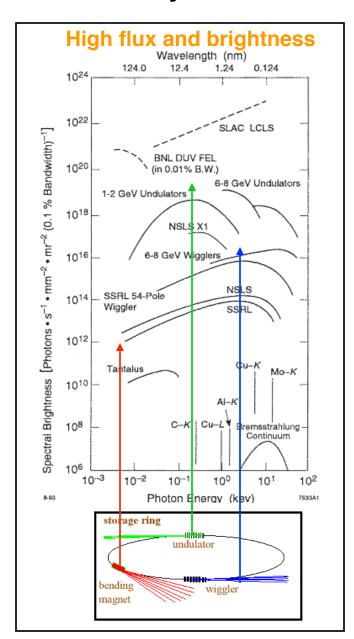

- (1) Electron gun
- (2) LINAC
- (3) Booster ring
- (4) Storage ring
- (5) Beamline
- (6) End station

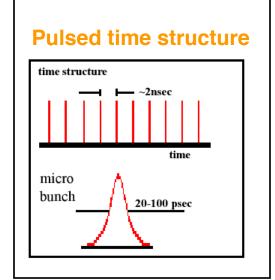

Cyclotron

Synchrotron Radiation - Basic Properties

Broad spectral range
Polarized (linear,
elliptical, circular)
Small source size
Partial coherence
High stability

Flux =
$$\frac{\text{# of photons in given } \Delta \lambda / \lambda}{\text{sec}}$$

Brightness = # of photons in given $\Delta \lambda / \lambda$

sec, mrad θ , mrad ϕ , mm² (a measure of concentration of the radiation)

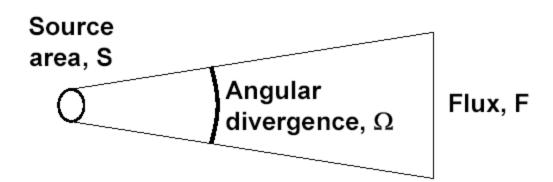

Basic Properties of Synchrotron Radiation

- 1. HIGH FLUX, BRIGHTNESS, STABILITY
- 2. BROAD SPECTRAL RANGE Tunability
- 3. POLARIZATION (linear, elliptical, circular)
- 4. PULSED TIME STRUCTURE (0.01 1 nsec)
- 5. SMALL SOURCE SIZE (≤ mm)
- 6. PARTIAL COHERENCE

The brightness of a light source

Flux =
$$\frac{\text{# of photons in given } \Delta \lambda / \lambda}{\text{sec}}$$

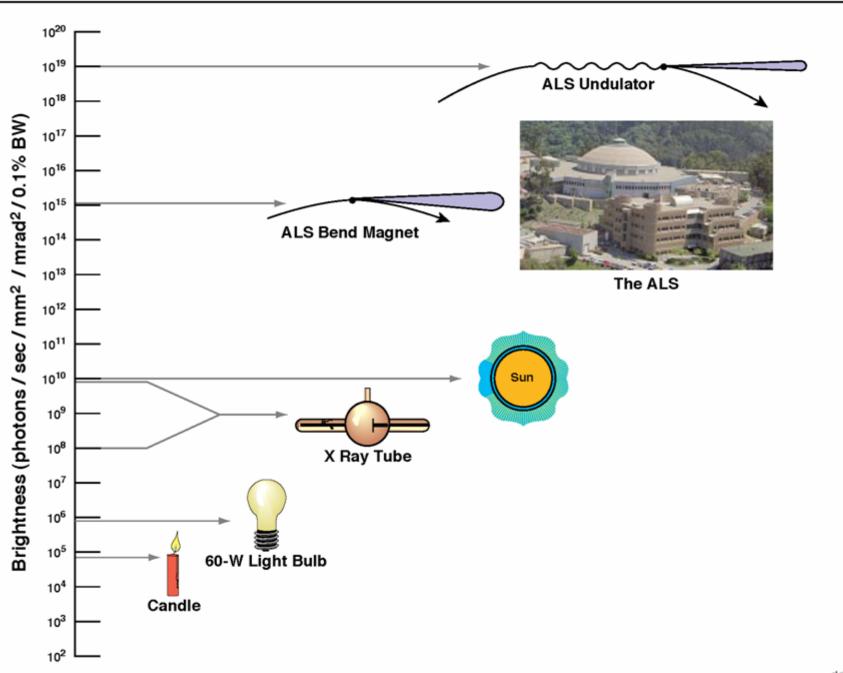

Brightness = $\frac{\text{\# of photons in given }\Delta\lambda/\lambda}{\text{sec, mrad }\theta, \text{ mrad }\phi, \text{ mm}^2}$ (a measure of concentration of the radiation)

Brightness = constant x
$$\frac{F}{S \times \Omega}$$

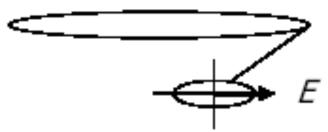

How Bright Is the Advanced Light Source?

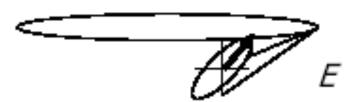

Polarisation

Synchrotron radiation observed in the plane of the particle orbit is horizontally polarized, i.e. the electric field vector is horizontal

Observed out of the horizontal plane, the radiation is elliptically polarized

How is it Practically Produced and Used for Research?

Beamline

The storage ring circulates electrons, where they are bent, synchrotron radiation is produced

Klystrons generate high power radio wave to sustain electron acceleration, replenishing energy lost to synchrotron radiation

Beam lines transport radiation into "hutches", where instrumentation is available for experiments

Electron gun produces electrons

Bending Magnet

RF Cavity

Quadrupole Magnet
Pulsed Injection Magnet
Sextupole Magnet

Transport Line

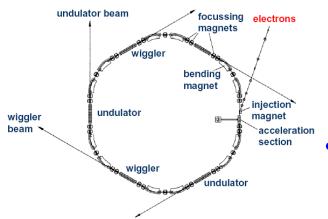

STORAGE RING

Wiggler / Undulator insertion devices generate strong x -ray beams

Linear accelerator/ booster accelerate e which are transported to storage ring

Bending magnet & insertion device

Storing Ring

Bending Magnet

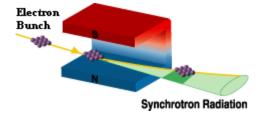

- White X-rays
- Wide horizontal divergence
- 1/ γ limited vertical divergence
- Moderate power
- Moderate power density

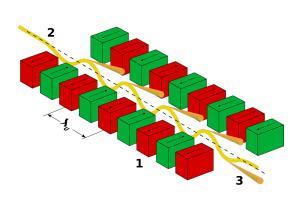

Wiggler

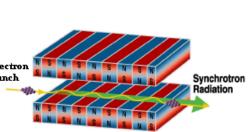

- White X-rays
- Moderate horizontal divergence Electron
- 1/γ Limited vertical divergence
- High power
- High power density
- Elliptically polarized/linearly polarized

Undulator

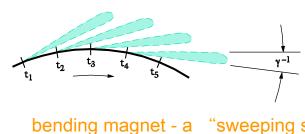

- Quasi-monochromatic X-rays
- Small vertical and horizontal divergence (Central Cone)
- High power
- Extremely high power density
- Circularly polarized/ linearly polarized

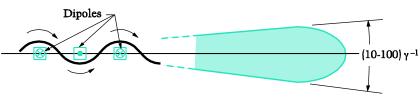

Bending Magnets and Insertion Devices on Storage Rings

bending magnet - a "sweeping searchlight"

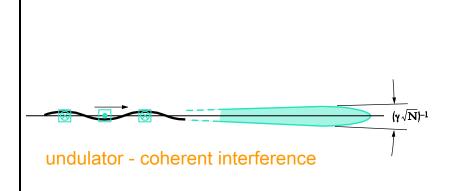

wiggler - incoherent superposition

Continuous spectrum characterized by ε_c = critical energy

$$\varepsilon_c(\text{keV}) = 0.665 \text{ B(T)E}^2(\text{GeV})$$

eg: for B = 1.35T E = 2GeV
$$\epsilon_c$$
 = 3.6keV

Quasi-monochromatic spectrum with peaks at lower energy than a wiggler

$$\lambda_1 = \frac{\lambda_u}{2\gamma^2} (1 + \frac{K^2}{2}) \sim \frac{\lambda_U}{\gamma_2}$$
 (fundamental)

+ harmonics at higher energy

$$\epsilon_1 \text{ (keV)} = \frac{0.95 \text{ E}^2 \text{ (GeV)}}{\lambda_u^{\text{ (cm)}} (1 + \frac{\text{K}^2}{2})}$$

 $K = \gamma \theta$ where θ is the angle in each pole

Synchrotron Radiation Facilities Around the World

54 in operation in 19 countries used by more than 20,000 scientists

(Brazil, China, India, Korea, Taiwan, Thailand)

8 in construction

Armenia, Australia, China, France, Jordan, Russia, Spain, UK

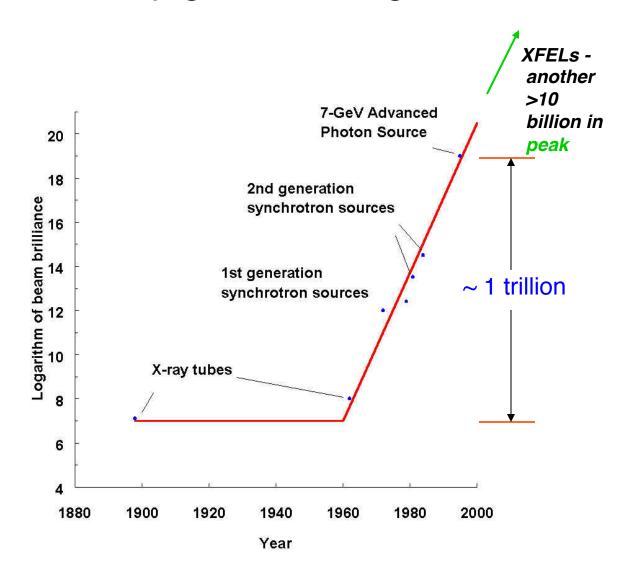

11 in design/planning

For a list of SR facilities around the world see

http://ssrl.slac.stanford.edu/SR_SOURCES.HTML

www.sesame.org.jo

Steep growth in brightness

Future of Synchrotron Radiation

- Higher Brightness
 - Free Electron Lasers
- Shorter Pulse Lengths
 - Femto (10⁻¹²) and Attosecond (10⁻¹⁵)
- Terahertz (T-rays)
 - Coherent Synchrotron Radiation

Taiwan Photon Source (TPS) – Hsinchu, Taiwan

Neutron Scattering

Neutrons have No Charge!

- Highly penetrating
- Nondestructive
- Can be used in extremes

Neutrons have a Magnetic Moment!

- Magnetic structure
- Fluctuations
- Magnetic materials

Neutrons have Spin!

- Polarized beams
- Atomic orientation
- Coherent and incoherent scattering

The **Energies** of neutrons are similar to the energies of elementary excitations!

- Molecular Vibrations and Lattice modes
- Magnetic excitations

The Wavelengths of neutrons are similar to atomic spacing!

- Sensitive to structure
- Gathers information from 10⁻¹⁰ to 10⁻⁷ m
- Crystal structures and atomic spacings

Neutrons probe Nuclei!

- Light atom sensitive
- Sensitive to isotopic substitution

de Broglie Wavelength

$$\lambda = \frac{h}{p} = \frac{h}{mv} = \frac{h}{\sqrt{2mE}}$$

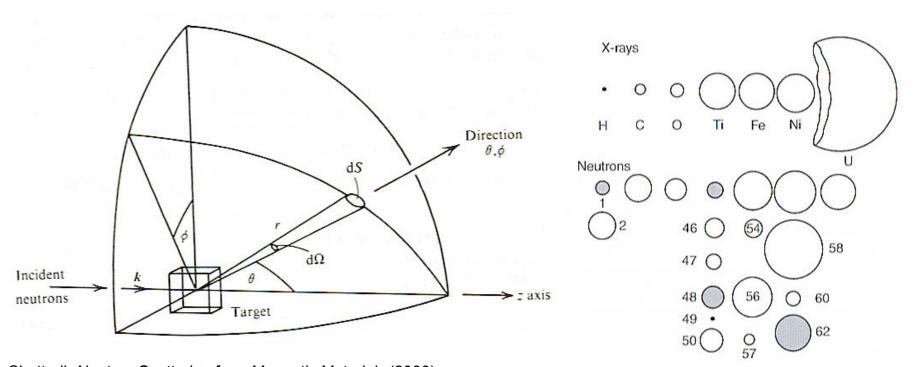

$$E = 81.6 \text{ meV}$$

$$v = 3950 \text{ m/s}$$

$$\lambda = 1 \times 10^{-10} \text{ m}$$

$$E = 81.6 \ meV$$
 $E = 1 \ meV$ $v = 3950 \ m/s$ $v = 437 \ m/s$ $\lambda = 1 \times 10^{-10} \ m$ $\lambda = 9 \times 10^{-10} \ m$

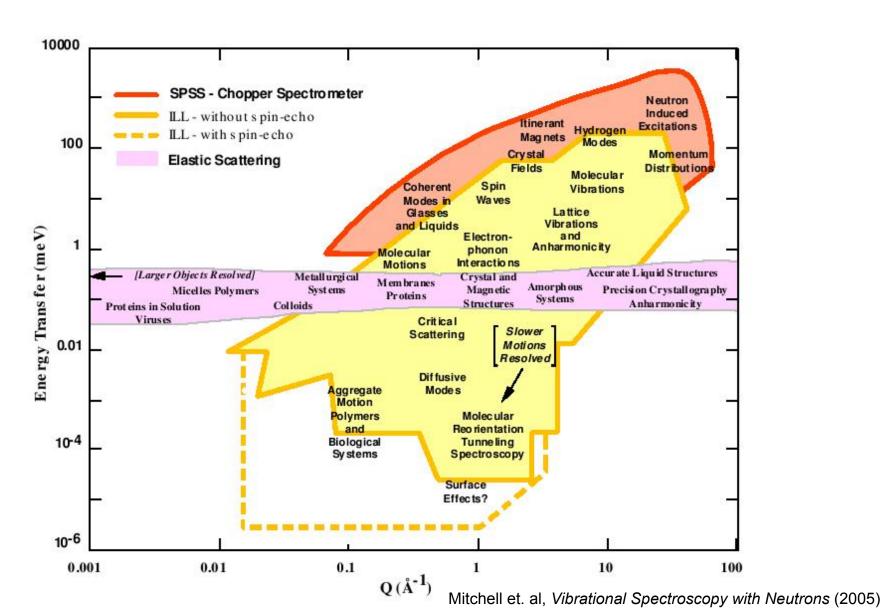

Neutrons vs. X-rays

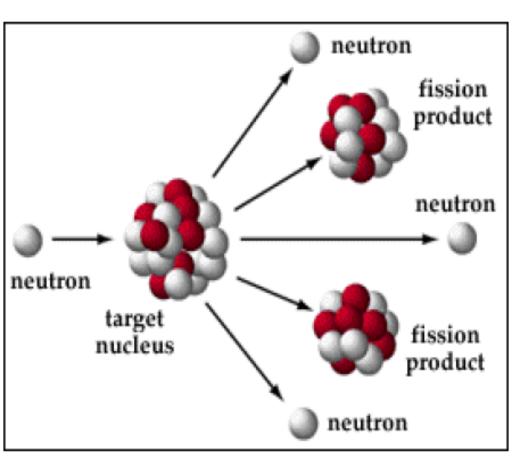

Chatterji, Neutron Scattering from Magnetic Materials (2006)

Neutrons allow easy access to atoms that are usually unseen in X-ray Scattering

How are neutrons useful?

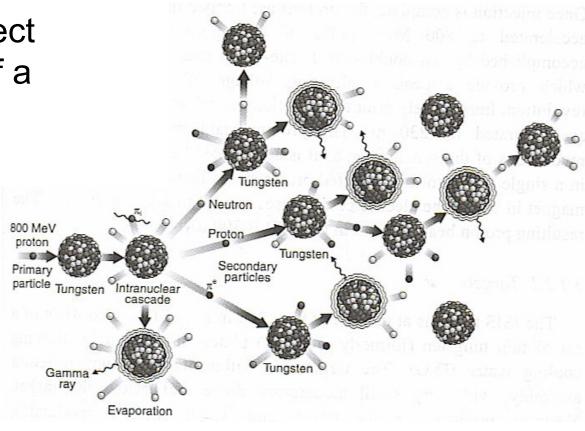

Neutrons from Reactor Sources

- Uses nuclear fission to create neutrons
- Continuous neutron flux
- Flux is dependent on fission rate
- Limited by heat flow in from the reaction
- Creates radioactive nuclear waste

Neutrons from Spallation Sources

- Uses a cascade effect from the collision of a proton on a heavy metal.
- Pulsed Source
- High Intensity
- Heat production is relatively low

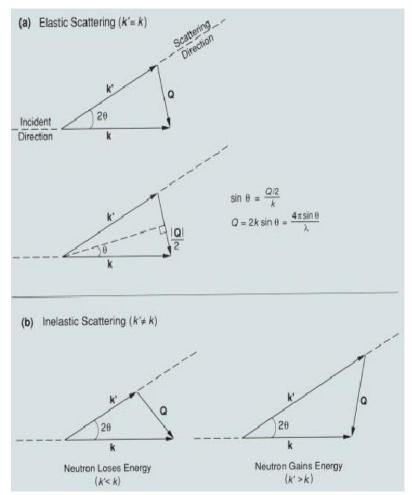

Neutron scattering

Elastic Neutron Scattering

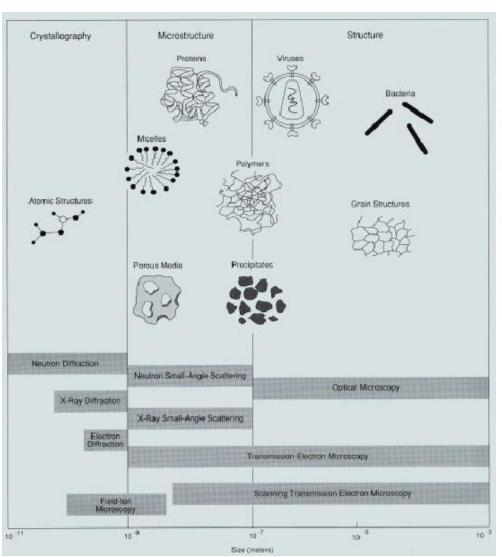

- No loss of energy
- Examines the change in momentum or angle of the neutrons.

Inelastic Neutron Scattering

 Examines both momentum and energy dependencies.

Elastic Neutron Scattering

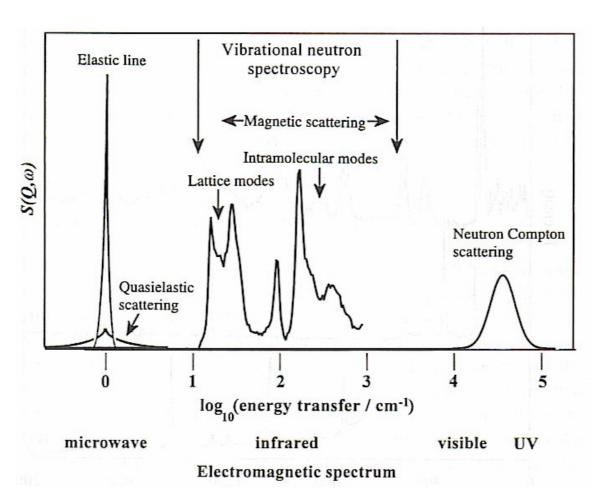

Pynn, Neutron Scattering: A Primer (1989)

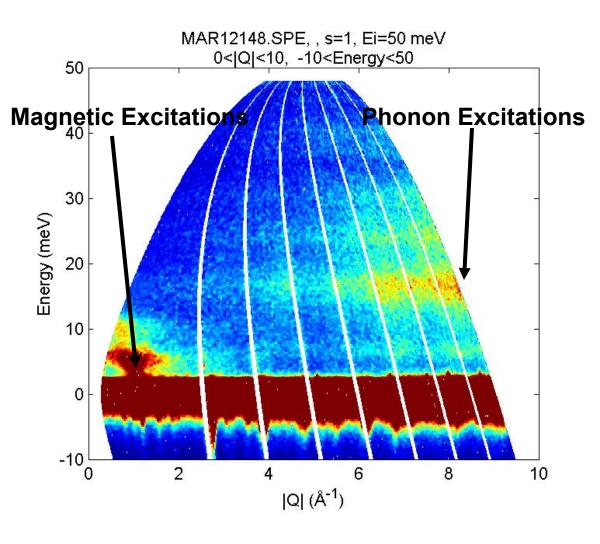

- Mitchell et. al, Vibrational Spectroscopy with Neutrons (2005)
 - Determine length scales and differentiate between nano-, micro-, and macrosystems.
 - Utilizes position and momentum correlation.

Inelastic Neutron Scattering

Uses both change in momentum and energy to characterize a systems vibrational, magnetic, and lattice excitations.

Vibrational and Magnetic Excitations

 Vibrational excitations are broad, large excitations.

Neutrons observe all phonon and vibrational excitations. The intensity is determined by the phonons polarization vectors.

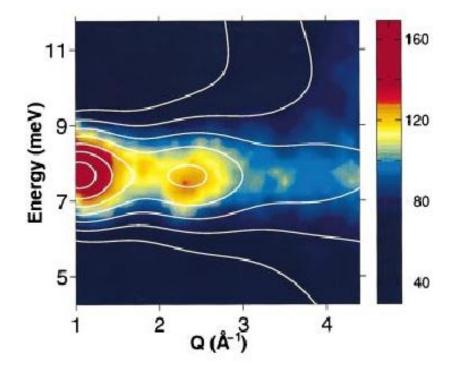

•Magnetic excitations are detailed by spin transitions of $\Delta S = 0$ and ± 1 .

Q-dependence of magnetic excitations help determine the magnetic structure within the material.

Inelastic Neutron Scattering from magnetic sample

The use of neutron scattering on the material of VODPO₄ • ½ D₂O clarified the magnetic structure of the material.

Tennant et. al, PRL (1997)
