

This workshop is built in an already strong and growing series of collaborations, focused in part around synchrotron radiation techniques. We can let the results of such collaborations speak by themselves and set the stage for the future. The collaboration, also involving Korean and American scientists, is now operating the premiere coherent radiology facility in the world. Established leadership at the world level has been achieved at least in four key areas: coherent radiology on live animals, coherent microangiography, coherent microradiology of cells, coherent microtomography. And the workshop creates the environment for further expansion and success in the future.
