

# AI Technology: An Observation from an Engineer

*Barry Lam*

*Founder and Chairman, Quanta Computer*

## Abstract of Presentation

- Artificial intelligence is changing the global technology landscape. Dozens of nations have recently made the development and regulation of AI a national priority strategy. One area where AI is already taking hold is health care.
- In this presentation I will offer some observations on the 3 issues related to the rapid AI and medical development.
- First, the presentation looks at the national strategies responding to the AI transformation at the global level, and the convergence of technology and medicine, from a viewpoint of an engineer.
- Secondly, it shares some perspectives on where A.I. has the most potential to improve health care, and where it might stumble.
- Finally, I will finish up with a case study of how an IT company tries to re-think, re-train, and re-invent itself through its 20 years journey.
